SiteDesk MVP: context diagram (system and data flows)

The system as one process, the external entities around it, and the data that flows in and out. Container view on page 2. SRS v2 §3, §7.

MVP SCOPE
Sign-in is simulated (not SSO). Embeddings run locally; the LLM is optional. Prices and stock come from mock-pos.

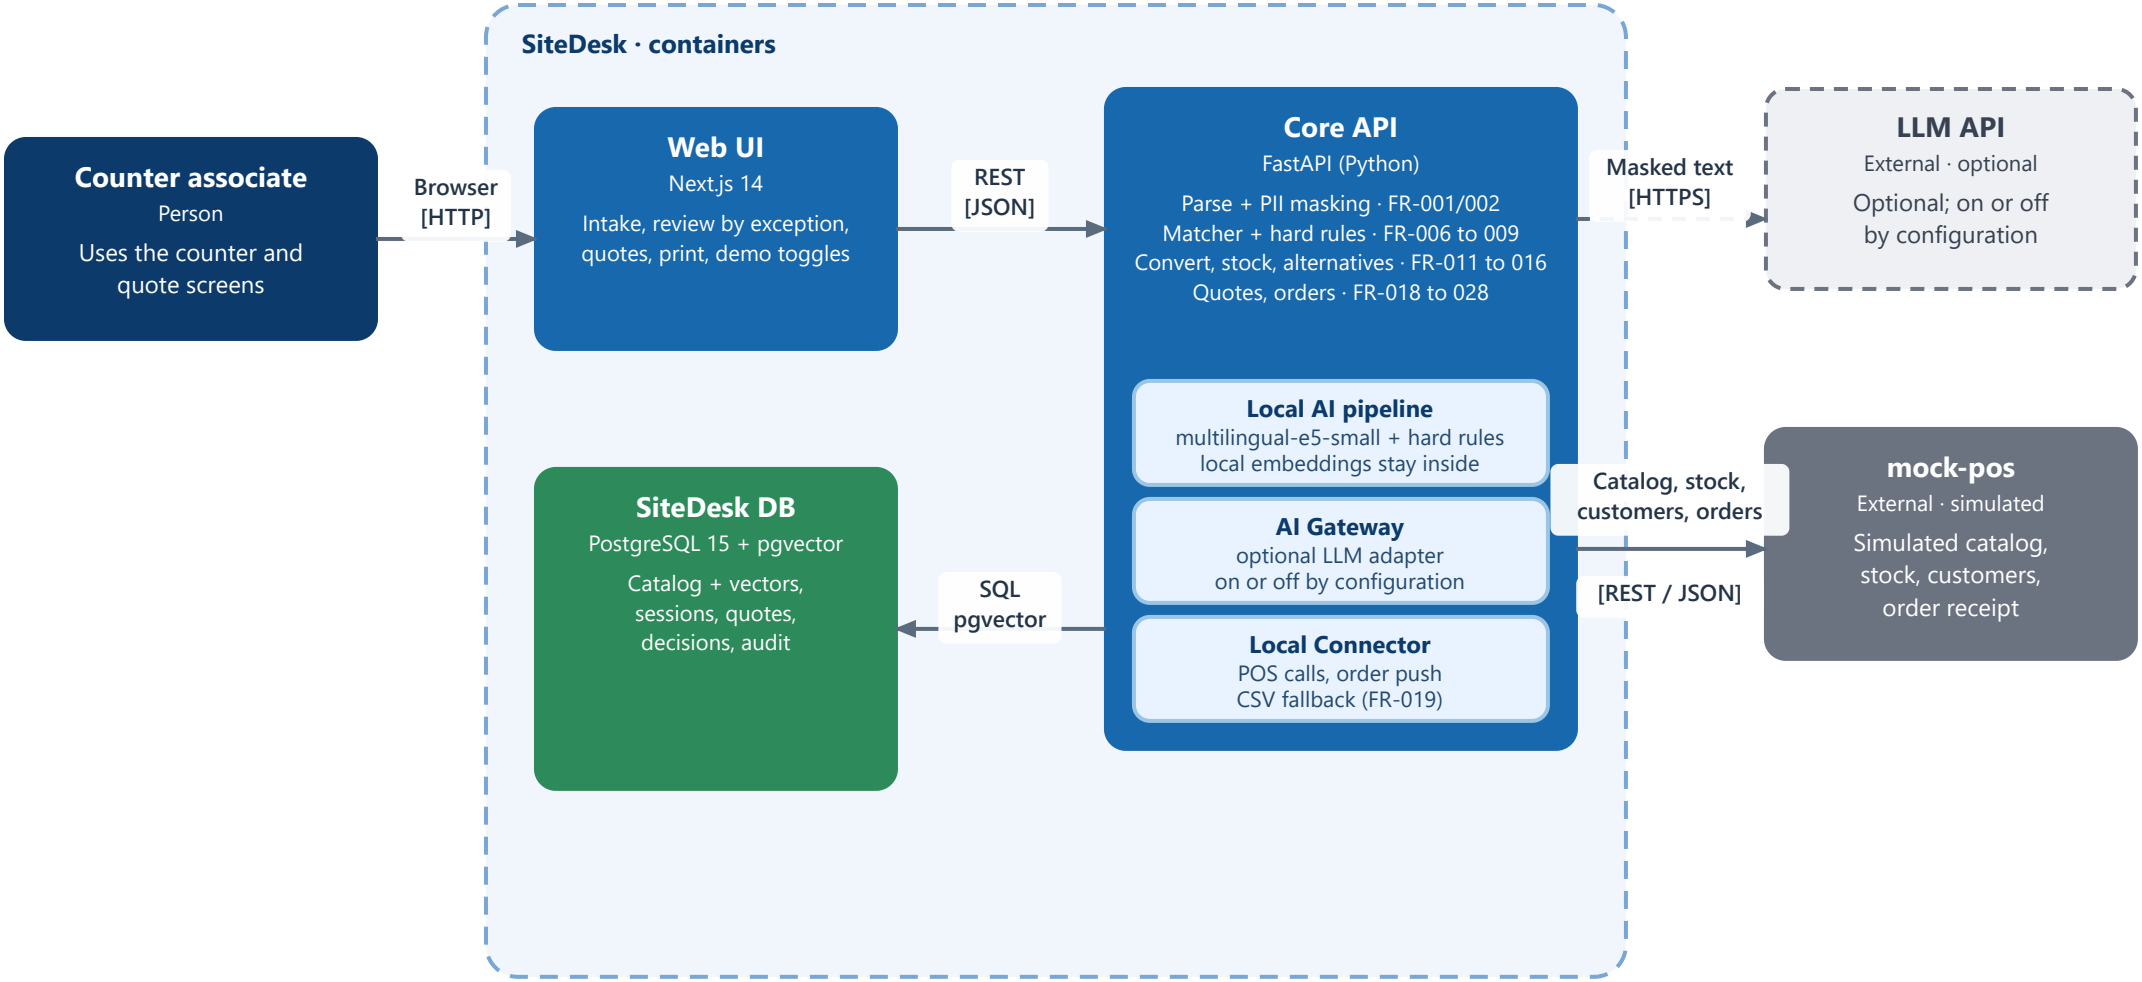

DATA LIMIT
A regex masks e-mail and phone before any AI call. Names and addresses in free text are not guaranteed removed.

OUTCOME
POS accepts: POS_ACCEPTED + reference. POS 503 or timeout: CSV and NEEDS_MANUAL; the POS has not accepted the order.

External entity (square) · System (circle) · Data flow, named by the data it carries · Optional or indirect flow · FR = requirement in the team's SRS v2

SiteDesk MVP: inside the system (containers)

What is inside the circle of page 1: deployable parts, the data store, and how they talk to each other and to the outside. Run locally with Docker Compose.

CONTAINER RULE

The AI Gateway and the Local Connector are in-process modules of the FastAPI core, not separate containers.
The vector index lives inside PostgreSQL (pgvector).

AI AND PRIVACY

Matching runs on local embeddings plus hard rules, so the AI path needs no external service.
The LLM, when enabled, sees e-mail/phone-masked text.

FALLBACK

POS 503 / timeout: the connector writes a CSV and the order is marked NEEDS_MANUAL, not POS_ACCEPTED.
AI off: rules and manual catalog search continue.
